DEPARTMENT OF INTERVENTIONAL RADIOLOGY

Interventional Radiology (IR) is a medical subspecialty which uses minimally invasive techniques under image guidance to diagnose and treat various conditions. Interventional Radiologist uses various imaging modalities like ultrasound scan, CT scan, MRI scan, fluoroscopy, X-ray etc to visualize deep seated organs and areas in human body perform minimally invasive procedures. Interventional Radiologist perform a wide range of procedures starting from taking FNAC or biopsy from deeper tissues to treatment of complex vascular diseases and tumors. These are done by placing small but sophisticated instruments like special needles, catheters, balloon, stents, particulate materials and drugs into different parts of body with the help of imaging. With continuing advances in medical imaging and technology, the scope of interventional radiology is expanding.

WHAT IS INTERVENTIONAL RADIOLOGY?

Interventional Radiology (IR) is a medical specialty that uses advanced imaging techniques such as ultrasounds, CT scans, or MRIs to look inside your body. Guided by these images, doctors use precise instruments like needles and catheters to perform procedures or deliver treatments directly to the affected area. Through tiny incisions, often as small as a pinhole, IR allows for the treatment of various conditions, including blood clots in blood vessels and fluid buildup, ensuring targeted and efficient care.

SCOPE OF SERVICES

24x7 Interventional Radiological Services

Outpatient Clinic

Advanced Procedures

- Angiograms of Brain, Limbs, and Abdominal Organs
- Gastrointestinal Interventions, Bariatric Interventions (Obseity)
- Cancer Treatments (TACE, Ablation), Bile Drainage for Jaundice, Treatment of Abdominal Bleeds and Collections
- Neurological and Head/Neck Interventions
- Emergency Embolisation for Vascular Injuries, Hemoptysis, Epistaxis

- Embolisation for Vascular Tumors Prior to Surgery
- Treatment of Uterine Fibroids and Uterine Bleeding Related to Pregnancy or Diseases
- Prostatic Artery Embolization for Prostate Enlargement
- Dialysis-Related Interventions
- Angioplasty/Stenting of Peripheral and Diabetic Foot
- Image-Guided Tissue Biopsies
- Image-Guided Percutaneous Drainage of Collections/Abscesses
